Light and sound: absorbed, reflected and refracted

★☆☆
Grade 4

Name: Class: Date:

Learning goals

- Explain how sound is made and how it travels through solids, liquids and gases.
- Explain loudness and pitch, and how sounds can be muffled.
- Show how light and sound can be absorbed, reflected and refracted.

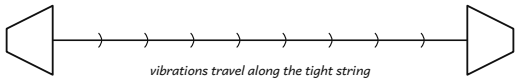

Light and sound both bring us news about the world. Light lets us see the Pohela Boishakh procession; sound lets us hear the dhol and the songs. Both travel from a **source** to our senses, and both change when they meet different objects.

How sound is made

All sounds are made by **vibrations**: very fast movements backwards and forwards. Pluck an ektara string and you can see it vibrate. Put your fingers on your throat and hum: you can feel your voice box vibrate.

How sound travels

The vibrating object makes the particles next to it vibrate, and they pass the vibration on, like a ripple. Sound can travel through **gases** (air), **liquids** (water) and **solids** (wood, metal, string). It travels best through **solids**, because their particles are close together. Sound cannot travel through empty space, because there are no particles to pass on the vibration.

A string telephone: sound travels along the tight string.

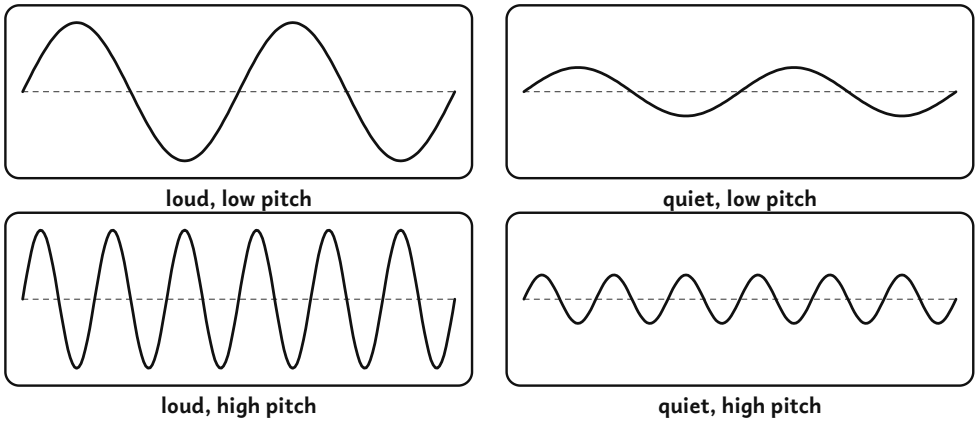

Loud and soft sounds

A **bigger** vibration makes a **louder** sound. Hit a drum gently and it is soft; hit it hard and it is loud. Sounds get quieter as they travel further away. Loudness is measured in **decibels** (dB).

High and low sounds

Pitch is how high or low a sound is. **Fast** vibrations make a **high** pitch; **slow** vibrations make a **low** pitch.

- **Strings**: a shorter, tighter or thinner string gives a higher pitch.
- **Drums**: a smaller or tighter drum skin gives a higher pitch.
- **Wind instruments** (like the *banshi*): a shorter column of air gives a higher pitch.

Comparing sounds as waves.

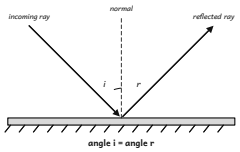

Muffling sound

Soft, thick materials such as cloth, foam, curtains and egg boxes **absorb** sound, so less sound gets through. This is called **muffling**. Ear defenders protect workers in noisy places. Hard, smooth surfaces such as walls and cliffs **reflect** sound, which can make an **echo**.

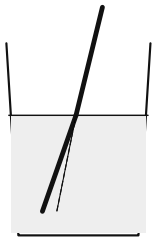

Light: absorbed, reflected, refracted

Light travels from a **source** (the Sun, a lamp, a flame) in straight lines. When it meets an object:

- Dark, dull objects **absorb** most of the light, so they look dark.
- Light-coloured and shiny objects **reflect** light. A mirror reflects light neatly, so we see a clear image.
- Transparent materials such as water and glass let light through, but **refract** it (bend it) as it goes in and out. That is why a pencil in water looks broken.

Reflection.

Refraction.

We see objects when light from a source reflects off them and enters our eyes. How things look depends on the **light source** (bright or dim, near or far) and on the **object** (its colour, whether it is shiny, see-through or rough).

Did you know?

Light is the fastest thing there is: about 300 000 km every second. Sound in air travels at only about 340 metres a second. That is why you see lightning before you hear the thunder.

Key words

vibration	a fast movement backwards and forwards
pitch	how high or low a sound is
loudness	how loud or soft a sound is
muffle	make a sound quieter by absorbing it
echo	a sound reflected back to you
absorb	take in light or sound
reflect	bounce off a surface
refract	bend light as it passes into a different material

FACT CHECK · C9 · LIGHT AND SOUND

Sound and light facts

★☆☆
Grade 4

Name: Class: Date:

Learning goals

- Recall how sound is made and travels.
- Use absorb, reflect and refract.

1 What vibrates to make the sound? [4]

Instrument	What vibrates?
dhol (drum)	
ektara	
banshi (flute)	
your voice	

2 Absorbed, reflected or refracted? [5]

What happens	Absorbed, reflected or refracted?
you see yourself in a mirror	
a black shirt gets hot in the sun	
a straw looks bent in a glass of water	
thick curtains make a room quieter	
you hear an echo in a big empty hall	

3 Fill in the gaps. [4]

WORD BANK

solids **higher** **louder** **vibrations** **lower** **gases**

Sounds are made by _____. Sound travels best through _____. A bigger vibration makes a _____ sound. Faster vibrations make a _____ pitch.

4 **True or false?** [3]

Statement	True	False	If false, correct it
1. Sound can travel through water.			
2. Sound can travel through empty space.			
3. A shorter string makes a higher pitch.			

Explaining sound and light

★★☆
Grade 4

Name: Class: Date:

Learning goals

- Explain pitch and loudness.
- Explain what we see.

1 **A Baul singer tightens the string of the ektara. What happens to the pitch? Why?** [2]

2 **Why can you hear a train coming sooner if you put your ear to the railway track? (Never try this!)** [2]

3 **Why do recording studios have soft foam on the walls?** [2]

4 **A white cat and a black cat sit in the sun. Which one looks brighter, and which one gets hotter? Explain.** [2]

5 **Draw arrows to show how you see a mango on a table in a sunny room.** [2]

Seeing a mango

INVESTIGATE · C9 · LIGHT AND SOUND

Which material muffles sound best?

★★☆ Grade 4

Name: Class: Date:

Learning goals

- Plan a fair test.
- Measure loudness in decibels.
- Draw conclusions.

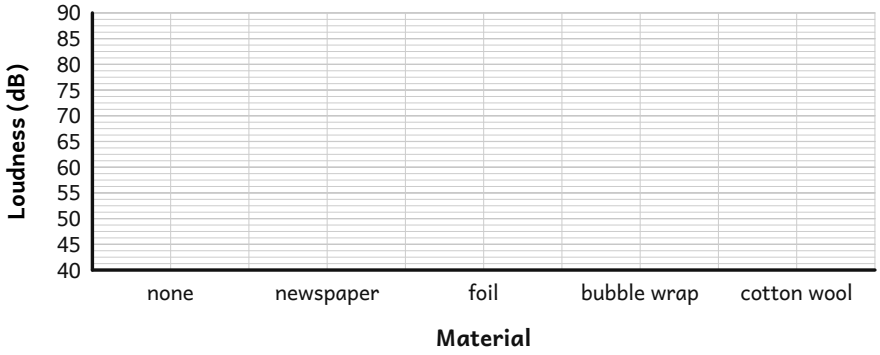

Class 4D put a phone playing a beep at the same volume inside a box. They covered the box with different materials and measured the loudness 1 metre away with a sound meter app.

1 **Complete the plan.** [3]

Change	
Measure	
Keep the same	

2 **Draw a bar chart.** [3]

Material	no cover	newspaper	foil	bubble wrap	cotton wool
Loudness (dB)	80	68	72	60	52

3 **Which material muffled the sound best? Suggest why.** [2]

.....

.....

4 **Why did they measure "no cover" first?** [1]

.....

5 **Which material would you use to make ear defenders? Why?** [1]

REAL-WORLD CASE STUDY · C9 · LIGHT AND SOUND

The music of the Bauls

★★★ Grade 4

Name: **Class:** **Date:**

Learning goals

- Apply sound science to traditional instruments.
- Link science with culture.
- Design an instrument.

Science · Music · Culture · Design

The **Bauls** are wandering singers of Bengal. Their songs, like those of **Lalon Shah**, talk about love, humanity and living simply. In **2005**, UNESCO recognised Baul songs as a treasure of the world's culture.

Bauls play simple instruments, often made by hand. The **ektara** has one string stretched over a hollow gourd; squeezing its bamboo neck changes the tension and the pitch. The **dotara** has more strings. The **dugi** (a small drum) is beaten by hand, and the **ghungur** (ankle bells) jingle as the singer dances. The hollow bodies of these instruments make the sound louder by vibrating with the strings.

Based on information about Baul music of Bangladesh (UNESCO Intangible Cultural Heritage).

1 **Complete the table.** [6]

Instrument	What vibrates?	How do you change the pitch?
ektara		
dugi (drum)		
banshi (flute)		

2 **Why does the ektara have a hollow gourd at the bottom?** [2]

.....

.....

3 **Design your own instrument from recycled materials. Draw it and explain how to make *a* high note and *a* low note.** [3]

My instrument

U	N	T	M	H	U	I	W	S	E

absorb echo light loud mirror pitch reflect sound vibrate

2 Which material is best at absorbing sound? [1]

- ◯ glass
- ◯ metal
- ◯ thick cloth
- ◯ tiles

3 A pencil in water looks bent because light is... [1]

- ◯ absorbed
- ◯ reflected
- ◯ refracted
- ◯ stopped

4 Draw two waves: a loud low sound and a soft high sound. [2]

loud, low

soft, high

5 **Challenge. Astronauts on the Moon talk to each other by radio, even when standing side by side. Explain why.** [2]

.....
