Healthy habits and germs

★☆☆
Grade 5

Learning goals

- Recall what we need to stay healthy.
- Link diseases to how they spread.

1 Fill in the gaps. [6]

WORD BANK

hygiene vaccine television exercise germs sugar sleep water

To stay healthy we need clean air and safe ___water___, good ___hygiene___, nutritious food, ___exercise___ and enough ___sleep___. Tiny living things that cause disease are called ___germs___. A ___vaccine___ trains the body to fight a germ.

2 Sort the diseases by how they spread. [4]

SORT THESE

dengue flu typhoid cholera malaria diarrhoea common cold tuberculosis

Dirty water or food	Air (coughs, sneezes)	Mosquito bites
cholera	flu	dengue
typhoid	tuberculosis	malaria
diarrhoea	common cold	

3 True or false? [5]

Statement	True	False	If false, correct it
1. All germs cause disease.		✔	Most germs are harmless; some are useful.
2. Washing hands with soap for 20 seconds removes most germs.	✔		
3. Diabetes spreads from person to person.		✔	Diabetes is not infectious; it is linked to lifestyle and genes.
4. Children aged 10 need about 9 to 12 hours of sleep.	✔		
5. Mosquitoes breed in standing water.	✔		

4 **Put the handwashing steps in order.** [3]

6	Dry with a clean cloth.
2	Add soap.
1	Wet your hands with clean water.
5	Rinse well.
3	Rub palms, backs of hands and between fingers.
4	Scrub nails and thumbs.

Causes, risks and choices

★★☆
Grade 5

Learning goals

- Link unhealthy conditions to diseases.
- Suggest behaviours that prevent disease.

1 **For each problem, name a disease it could cause and a way to prevent it.** [8]

Problem	Possible disease	How to prevent it
drinking pond water	diarrhoea / cholera	drink boiled, filtered or tube-well water
flower tubs full of old rainwater	dengue	empty and clean the tubs every week
eating without washing hands	diarrhoea, worms	wash hands with soap before eating
sitting with screens all day, eating crisps and sweets	obesity, diabetes later	exercise every day; eat a balanced diet

2 **Explain why a vaccine protects not only you but also other people.** [2]

If you cannot catch the disease, you cannot pass it on; when many people are vaccinated the germ cannot spread easily, protecting babies and sick people too.

3 **A child has diarrhoea and is losing a lot of water. Why is ORS more helpful than plain water?** [2]

ORS replaces the salts the body has lost as well as water, and the sugar helps the body absorb the salts and water.

4 **Rafi says, "I slept for 5 hours, but I'm fine." Explain why sleep matters for children.** [2]

Sleep helps the body grow and repair, helps the brain learn and remember, and helps the body fight infection.

INVESTIGATE · A3 · STAYING HEALTHY

How well do we wash our hands?

★★☆
Grade 5

Learning goals

- Plan a fair test using a model of germs.
- Present results in a bar chart.
- Draw a conclusion and evaluate the method.

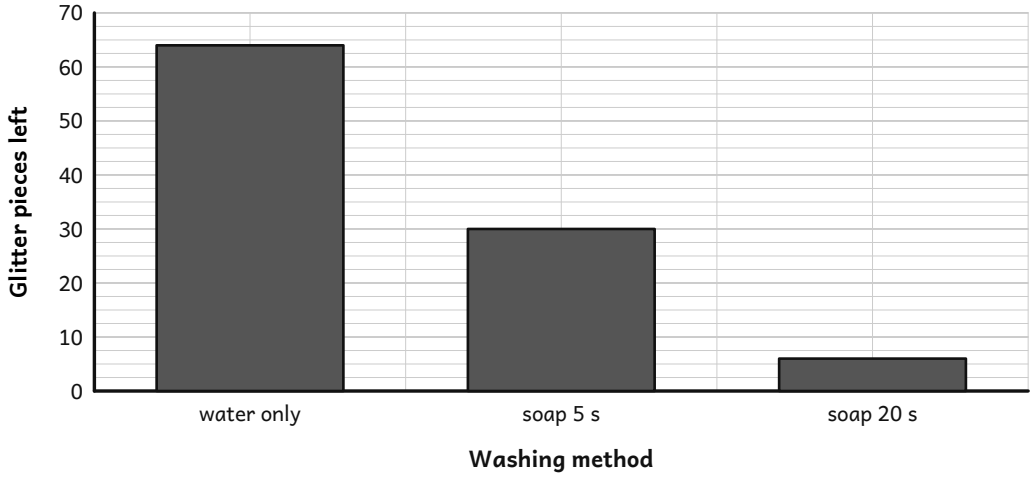

Germs are too small to see, so Class 5C used a **model**: they rubbed a teaspoon of cooking oil mixed with glitter onto their hands. The glitter stood for germs. Then they washed in different ways and counted the glitter pieces left on one hand.

1 **Name the variables.** [3]

What we change	the way of washing (water only / soap 5 s / soap 20 s)
What we measure	the number of glitter pieces left on the hand
What we keep the same	amount of oil and glitter, water temperature, same hand, same person counting

2 **Here are the results (average of 3 learners for each method).** [4]

Method	water only	soap, 5 seconds	soap, 20 seconds
Glitter left	64	30	6

3 **Write a conclusion.** [2]

Washing with soap removes more "germs" than water alone, and washing for 20 seconds works best.

4 **How is the glitter model like real germs, and how is it different?** [2]

a) Like real germs:

it sticks to hands and spreads to things we touch; soap helps remove it

b) Different from real germs:

glitter is much bigger and visible; it is not alive and cannot multiply

REAL-WORLD CASE STUDY · A3 · STAYING HEALTHY

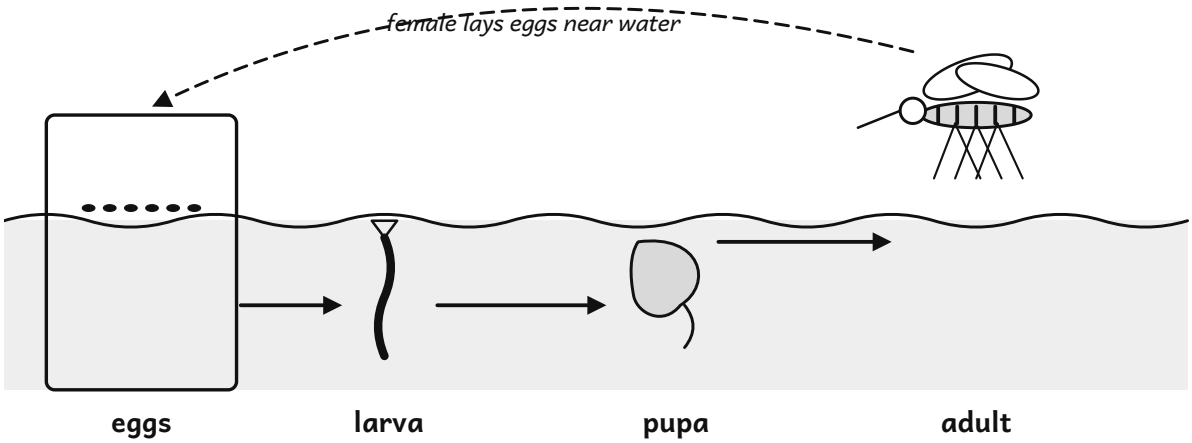

Dengue: a city fights a mosquito

★★★
Grade 5

Learning goals

- Explain how a disease spreads using a life cycle.
- Interpret data about cases over the year.
- Argue for actions that reduce risk.

Science | Health | Maths | Geography | Citizenship

Life cycle of the Aedes mosquito. From egg to adult takes about 7 to 10 days in warm weather.

Dengue is a disease caused by a virus. It is spread by the bite of the female **Aedes** mosquito, which has black and white stripes and often bites in the daytime. Symptoms include a high fever, headache and pain in the muscles and joints. Most people recover with rest and fluids, but some become seriously ill and need hospital care.

Aedes mosquitoes lay their eggs in small amounts of **clean, still water**: flower tubs, old tyres, plastic containers, rooftop gardens and building sites. The eggs can survive dry for months and hatch when it rains.

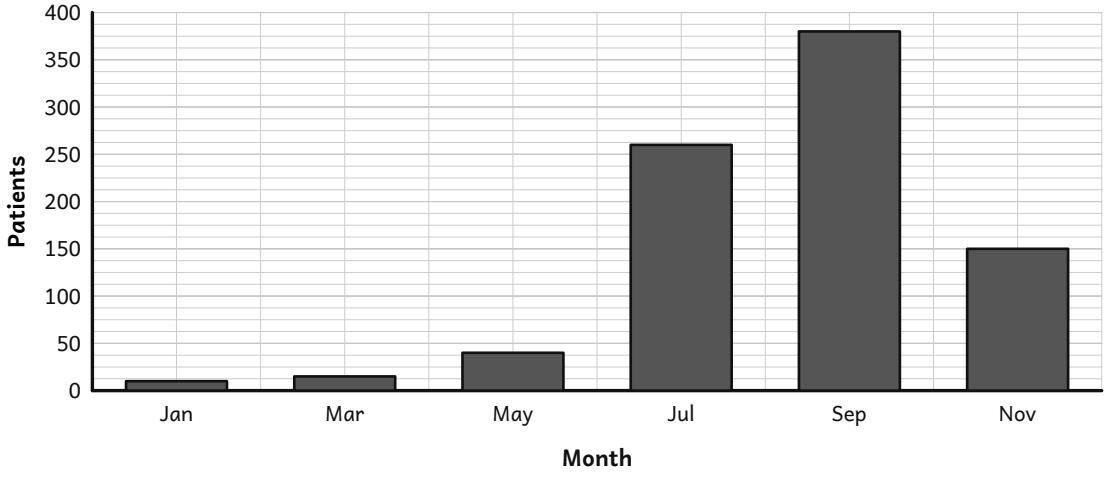

Dengue cases in Bangladesh rise during and after the monsoon. **2023 was the worst dengue year on record in the country.** City corporations spray to kill mosquitoes and run "clean-up" campaigns, but experts say every household must help by removing breeding places.

Information: Directorate General of Health Services (DGHS) and WHO dengue fact sheets.

1 **Use the life cycle to explain why emptying water containers every week stops mosquitoes.** [2]

Mosquitoes need water to grow from egg to larva to pupa (about 7–10 days). Emptying the water every week kills the young stages before they become adults.

2 **This chart shows example numbers of dengue patients in one city hospital each month.** [5]

Month	Jan	Mar	May	Jul	Sep	Nov
Patients	10	15	40	260	380	150

a) Draw the bars on the chart.

b) In which months are there most cases? Suggest why.

July to September (monsoon): lots of rain leaves water in containers where mosquitoes breed.

c) How many more patients were there in September than in May?

380 – 40 = 340

3 **Who is responsible for stopping dengue? Give one job for each.** [3]

Who	What they can do
each family	empty water containers weekly; use nets and repellent; cover water tanks
schools	check the grounds and roof for standing water; teach learners
the city	clean drains, remove rubbish, spray, inspect building sites

4 **Design a short poster message (no more than 12 words) to persuade your neighbours to act.** [2]

Your message

e.g. "Empty it, cover it, clean it: no water, no dengue!"

Show what you know

★★★
Grade 5

Learning goals

- Use key vocabulary.
- Answer test-style questions.

1 **Find the key words.**

K	D	E	N	G	U	E	J	K	T	M
P	V	E	X	E	R	C	I	S	E	V
K	G	D	H	J	F	S	U	S	W	J
C	F	S	W	Y	G	A	U	L	V	G
S	Y	L	D	A	G	W	M	J	I	E
O	J	E	V	G	T	I	D	O	R	R
A	G	E	K	O	M	E	E	B	U	M
P	S	P	Y	D	I	D	R	N	S	V
D	G	G	K	F	Y	E	P	B	E	P
U	R	I	L	U	P	V	T	B	D	P
V	A	C	C	I	N	E	E	U	Y	P

dengue **exercise** **germ** **hygiene** **sleep** **soap** **vaccine** **virus** **water**

2 **Which disease is spread by mosquitoes?** [1]

- ○ cholera
- ● **dengue**
- ○ flu
- ○ typhoid

3 **Which is the best way to make pond water safer to drink?** [1]

- ○ let it stand for an hour
- ● **boil it**
- ○ add sugar
- ○ put it in the fridge

4 **Choose one disease you learned about. Write its cause, one risk factor and how to prevent it.** [4]

Disease	e.g. cholera
Cause	bacteria in dirty water or food
Risk factor	drinking unsafe water; poor sanitation
Prevention	safe water, latrines, handwashing, vaccine

5 **Challenge. Explain why a city with good drains, clean water and toilets has fewer cases of diarrhoea.** [2]

Diarrhoea germs spread through dirty water and human waste. Good drains, toilets and clean water keep waste away from drinking water and food.
